Do Not Use or Operate this Equipment

Until you have Read and Understood this Manual

The purpose of this manual is to explain maintenance requirements and adjustments which are necessary for the most efficient operation of the machine. Read this manual thoroughly and completely before using your machine. Keep this manual handy for reference when questions arise.

Should you have questions or difficulties which your dealer or representative are unable to answer, please call or write:

Bigham Brothers, Inc. 705 E. Slaton Rd. P.O. Box 3338 Lubbock, TX 79452
Telephone: (806) 745-0384 Fax: (806) 745-1082

SAFETY FIRST

**PREVENT ACCIDENTS BY "THINKING SAFETY"

BIGHAM BROTHERS, INC.

A MESSAGE TO THE OWNER AND OPERATOR:

This machine was carefully designed and manufactured to give you dependable service. To keep it running efficiently, read the instructions in this Operator's Manual. Check each item and acquaint yourself with the adjustments required to obtain efficient operation and maximum performance. Remember, the machines performance depends on how you operate and care for it.

After the operating season, thoroughly clean your machine and inspect it. Preventive maintenance saves time and pays dividends. Your dealer has original equipment parts which assure proper fit and best performance. Record the model number, serial number and date of purchase in the space provided on this page. Your dealer needs this information to give you efficient service when you order parts or attachments. The model number and serial number appear on the identification plate on the front left side of the tool bar mast.

The Warranty on your machine is included with this manual. Your dealer will review both this manual and the warranty with you when you take delivery of your machine.

WARRANTY

Bigham Brothers, Inc. warrants all products of its manufacture to be free from defects in materials and workmanship for a period of six months from date of delivery to the retail purchaser. Parts assumed to be defective must be returned F.O.B. Lubbock, Texas for our inspection or inspected in the field by our authorized representative. Our obligation under this warranty is limited to replacement or repair of the defective part and does not cover other damages to persons or property. Other than the aforesaid, no warranties of merchantability or fitness for a particular purpose will apply. We do not assume liability for altered or remanufactured components or machines or applications beyond their intended use. Some states do not allow limitation of how long an implied warranty lasts, or exclusions of, or limitations on relief such as incidental or consequential damages, so the above limitations or exclusion may not apply to you. This warranty gives you specific legal rights and you may have other rights which vary from state to state.

Warranty does not cover damage due to abuse, neglect, collision, towing, pulling, normal wear and tear or any other factor beyond the control of the manufacturer. Tool bars that are bent, bowed or that have been welded on or modified in any way are specifically excluded from any warranties.

LIMITED LIFETIME WARRANTY ON TOOL BAR CLAMPS

Bigham Brothers, Inc. will replace any ductile iron clamp body that breaks or cracks under normal use for as long as the original purchaser owns them. This includes all replaceable bolt ductile iron clamps sold by Bigham Brothers, Inc. after December 31, 1987.

Clamps that fail should be returned to Bigham Brothers, Inc. freight prepaid along with caps, bolts, set screws and nuts for evaluation. If found to have failed under normal operating conditions, a new clamp body will be returned along with your old caps, bolts, set screws and nuts. Only clamps that have been used with Grade 2 bolts of the proper size will be replaced. All other provisions of the above warranty apply.

 **Be alert when you see this symbol in the instructions.**

It warns of a hazard which might lead to injury.

It means: "Attention! Become alert! Your Safety Is Involved!"

Before Use:

DO NOT operate this equipment until this

manual has been read and understood.

- * Assure operators have read and are familiar with the instructions contained in the Operator's Manual
- * If working on the Paratill, make sure it is level and stable. Proper stands should be lowered and secured. Use support blocks when necessary. The work area should be on a level, load bearing surface, e.g. concrete floor. NEVER, NEVER work under a Paratill while it is supported by only the tractor's hydraulics.
- * Consult the "Tractor Manufacturers Manual" for instructions on safe mounting of implements and operating methods.
- * Never stand between the Paratill and tractor with engine running.

During Use:

- * Check and tighten all bolts after 30 minutes of initial operation and after adjustments have been made.
- * Assure the Paratill is correctly attached to the tractor.
- * Be alert to underground obstructions, e.g. large stones, tree roots, cables, pipe lines, etc. Should an obstruction be encountered, **STOP IMMEDIATELY AND INVESTIGATE.**
-  **NOTIFY THE APPROPRIATE AUTHORITY IF BURIED CABLES OR PIPELINES ARE SUSPECTED.** Non-hazardous obstructions should be removed before continuing operation.
- * Keep operating speeds at a safe level.
- * Never allow anyone to ride on the Paratill during operation.
- * Never travel in reverse with the Paratill in the operating position.
- * Never carry out adjustments or repairs to a mounted Paratill unless the tractor engine is stopped and the Paratill is firmly supported or lowered to the ground.
- * Inspect the Paratill for wear or damage on a regular basis.
- * Check all nuts, bolts and other fasteners for tightness on a regular basis. Replace worn fasteners as needed.
- * Carry out maintenance and lubrication procedures as detailed in this manual.
- * When disconnecting the Paratill do so on a level, hard surface. Assure it is left in a stable position with proper stands in the correct position.

Always:

- * Wear gloves and safety footwear when handling worn parts with sharp edges.
- * Assure the Paratill is not operated by untrained persons.
- * Use the Paratill only for the purpose for which it was designed and tested, and always according to the instructions contained in this manual.
- * Reduce speed when transporting over uneven or rough terrain.
- * Place a "Slow Moving Vehicle" emblem on the rear of the unit before driving on open roads.
- * Keep hands, feet and clothing away from all moving parts.
- * Exercise care when adjusting legs, leg spacings, disc coulters or rear bedding tools.. The assemblies are heavy and may have sharp edges.

"Left" and "Right" of the machine refers to the side when standing behind the Paratill and facing the tractor. Left and right leg refers to direction of foot offset when standing behind the unit; not on which side it is located.

BIGHAM BROTHERS, INC.

**BE A SAFE OPERATOR, THINK BEFORE OPERATING.
READ ALL INSTRUCTIONS BEFORE
ASSEMBLY OR OPERATION OF THE PARATILL!**

Picture 1- Six Leg Paratill P/N 907-575T

INTRODUCTION:

Soil compaction and hardpan can quickly become a limiting factor to crop yields. These conditions can be created by many factors including field traffic, livestock and working fields that are too wet. As soil density increases, a physical barrier develops which seriously inhibits plant root development and water movement through the soil.

The Bigham Brothers Paratill® is a unique soil loosener that reduces soil compaction in a single pass. The patented angled leg design lifts and "bends" or fractures the soil, then allows it to settle in a loosened state. Surface residue remains on the surface for erosion control. Deep placement of fertilizer may also be accomplished by installing delivery tubes to the rear of each leg. The Paratill® should not be operated in wet soils nor in actively growing crops. It should be operated only in dry soil conditions, prior to planting, and prior to Fall and Winter precipitation. This will allow maximum absorption and storage of water for future use.

P/N	Description	Usable Tool Bar Length	Qty. Rear Shanks	Qty Coulters	Approx. Ship Wt.
907-562	Paratill®, 2 Leg with Coulters	8'4"	-	2	1475 Lbs.

(806) 745-0384

705 E. Slaton Rd.

P.O. Box 3338

Lubbock, TX 79452

BIGHAM BROTHERS, INC.

The BIGHAM BROTHERS PARATILL is equipped with an equal number of "right hand" and "left hand" legs. The PARATILL is designed to operate at a 14" to 16" working depth. Each leg loosens a zone of soil 20" to 26" wide, depending on soil conditions and leg spacing. **NOTE:** It is strongly advised that the depth of the soil problem be identified and the working depth of the PARATILL set to operate below the problem. Research shows that most compaction is within 14" of the surface of the soil. Working deeper than 16" rarely has any economic response. Operating deeper than 16" drastically increases power consumption.

Center of the Loosened Zone (CLZ)

Because of the unique design of the Paratill Leg, the zone of loosened soil is not centered over the point, but rather is away from the point in the direction of the leg angle, see Figure 1.

Each Paratill leg loosens an area of soil above and beyond the angled portion of the leg and wear point. The center of this loosened area on the soil surface is called the "Center of the Loosened Zone" or CLZ. The CLZ should correspond to desired row spacing, **but will not match** Leg or point spacings.

The factory uses a theoretical CLZ to calculate the initial location of each leg on the tool bar. The leg locations for various row spacings are listed in Figures 2,3,4,5, 6 & 7. Note: Leg or point measurements will not correlate to conventional row spacing measurements. The theoretical CLZ is estimated to be 2" beyond the wear point (10-1/4" from the vertical portion of the leg). If the points were set to operate in the center of a bed, ridge or row, the normal uplifting of the soil up and over the leg and point would physically move the row approximately 2" away from the point.

The distance from the leg or point to the CLZ is **not a constant**. Soil profile, type, condition and moisture may affect this distance, as well as operating speed and condition of the wear surfaces and points of the Paratill. Important: In most cases this theoretical CLZ has proven satisfactory, but if the CLZ in actual field operation is not at the desired location, the legs must be repositioned.

Checking Performance and Loosening

The degree and extent of loosening may be checked by several methods.

A. Probe: A penetrometer can be purchased which will

provide a reading in #/in required to push the unit into the ground.

One can make a probe from a piece of 48" x 3/8" round rod. Sharpen one end as you would a pencil, and bend the opposite end to form an "L-shaped" handle. Although no readings can be taken, one can easily determine the amount of force required to push the probe into the soil and if compaction has been eliminated.

Another indicator of how complete and uniform the soil is being loosened is for the tractor operator to observe the uniformity of the soil flowing over the legs as the unit is being operated. Uneven flow could indicate a leg spacing that is too wide.

Total soil loosening performance may also be checked by observing the soil finish behind the Paratill. The surface should be uniform. If the surface has mounds and valleys, generally this indicates the leg spacing is too wide and total loosening is not being accomplished between the legs.

One can also dig a pit or trench and inspect the degree and extent of loosening across the working width of the unit.

Figure 1

Zone Loosening

Each Paratill leg produces a zone of loose soil where the crop is to be planted and an unloosened area between the zones to support field traffic without putting compaction back into the crop growing area. See Figure 1.

Right-hand and left-hand legs can be mounted on the tool bar in many different layouts to suit particular crops, growing systems, prevailing soil conditions and the desired loosening effect. The more common layouts for leg spacings are shown in Figures 2,3,4,5, 6 & 7.

BIGHAM BROTHERS, INC.

Total Loosening

A row spacing of 24" to 26" is recommended for total loosening. This spacing will vary with different soil conditions. In some extreme cases a spacing as narrow as 22" or as wide as 28" may be required. It is important to remember that prevailing soil conditions determine the optimum leg spacing to achieve the maximum desired effect.

Changing Row Spacing

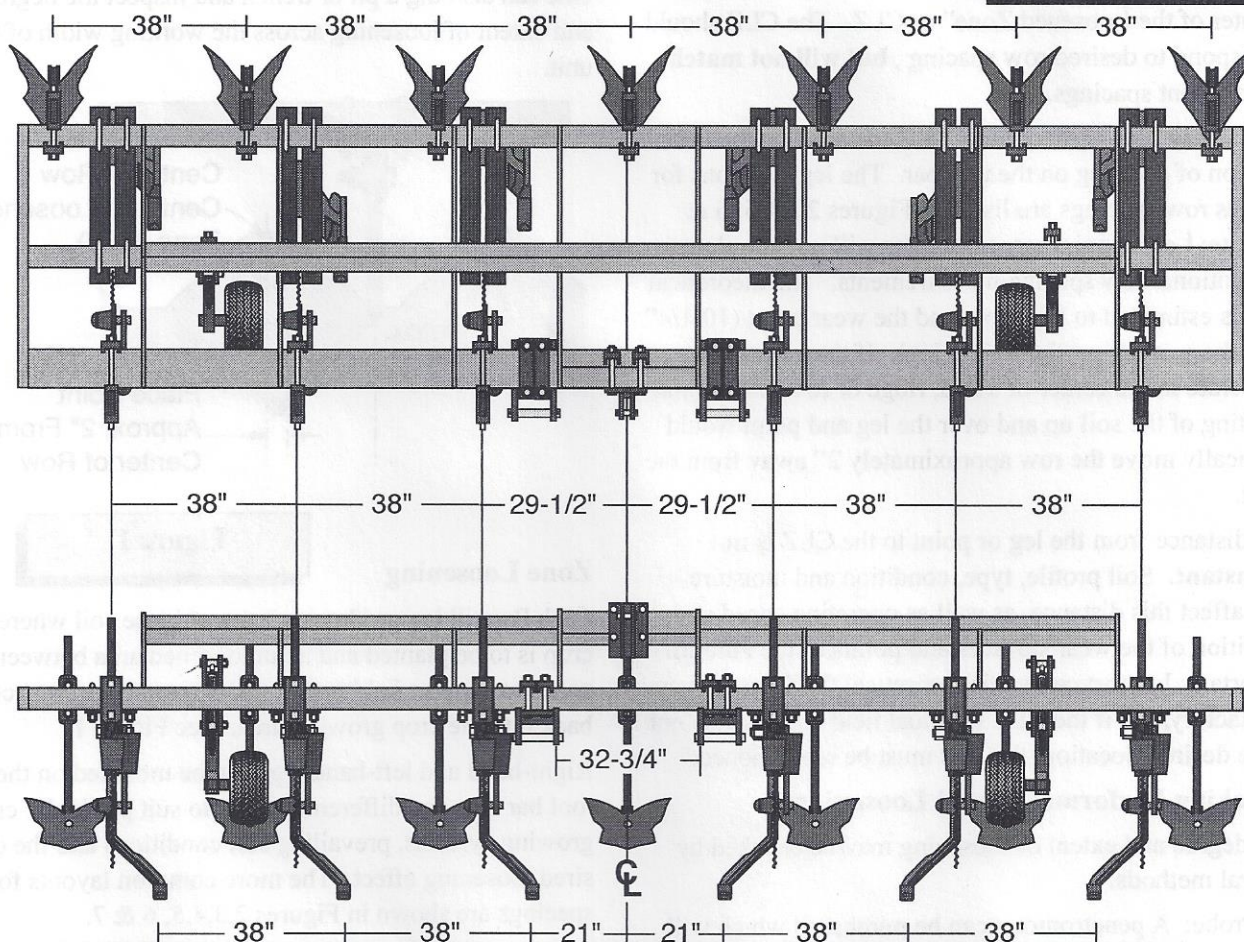

Refer to Figures 2,3,4,5, 6 & 7 for leg locations for desired row spacing. Leg spacings can be changed, but require considerable loosening and tightening of bolts; therefore an air or electric wrench is recommended. See Figure 8, page 13 for additional set-up information.

CAUTION: The legs and brackets are heavy, so if possible; utilize two men and do not rush.

The four U-Bolts that attach each leg to the tool bar must be loosened before the leg position can be changed. Loosen the nuts on each U-Bolt to allow the clamp to slide laterally along the tool bar. Leg position can be changed easily this way unless the desired leg position will 'jump' across a tool bar stringer (brace). Start with the center two legs and work to the outside. Be sure to align coulter in front of each leg to insure proper performance. When adjustments have been made be sure all bolts and nuts are tight. After leg repositioning, inspect all bolts after placing the unit back into service for about 15 minutes. Retighten bolts if necessary. Note: Placement of legs for Total Loosening requires a split hitch or offset coulters for proper coulter blade placement. Some row spacings may also require the use of a shank offset kit for proper furrow cleanout placement. If you feel that these spacings will be needed please indicate at time of order or before placing unit into service so substitutions can be made.

P.O. Box 3338

Lubbock, TX 79452

BIGHAM BROTHERS, INC.

When hard dry soil conditions are present the traditional standard leg spacing (with all legs set to the center of the plow) has caused clodding in the tractor wheel furrows in some instances. After experimentation we have found that the spacing diagram below reflects an alternative leg pattern that will help to relieve this clodding problem. We recommend this pattern if you are forced to operate under these types of soil conditions.

Figure 3

Leg: Shear Bolt

1. Each of the legs is protected by a shear bolt in the front hole attaching the leg to the clamp. The shear bolt is designed to break at a pre-set level that will prevent damage to other PARATILL components.

Use of a higher grade bolt without the special machined cuts could result in breakage or failure of machine components and will void the warranty. When replacing a shear bolt,

carefully line up the holes before inserting the replacement bolt. (P/N 610-1822Z).

2. A Grade 5 bolt (P/N 602-1822Z) is placed in the rear of the clamp

to provide a pivot in the event of shear bolt breakage. Do not place a shear bolt in the rear of the clamp.

3. The clamp is designed to allow the leg to be set in three different positions from front to back. If coulters are used on the front bar, the middle or back positions should be used.

4. U-Bolts that attach the clamp to the tool bar should be kept tight, particularly after adjustments have been made. When making adjustments, U-Bolts may be loosened but not removed to allow the clamp and leg to slide along the tool bar.

Leg Wear Parts

Each leg is protected by six high quality, replaceable wear parts: 5. Point, 6. Instep, 7. Lower Shin, 8. Upper Shin, 9. Shatter Plate, and 10. Landside.

Picture 2

Insure all leg wearing parts are changed before damage occurs to the Leg (or Foot).

Each part should be replaced as it becomes worn. Failure to replace worn parts could result in permanent Leg damage. See Parts Diagram on Page 14.

There are two Wear Shins per Leg; The right-hand Shins are different from the left-hand Shins. The Lower Shins are shorter than the Upper ones, and they usually require replacement more often due to their location in a greater wear area than the upper ones.

The Landside (P/N 681-006) is made of a hardened alloy material and is designed to support the rear of the point.

The Wear Point is reversible and self-sharpening and should be rotated or turned over before the Point has become pointed on the end or worn excessively. Another indication that the Points need to be turned or replaced is when the Paratill unit fails to penetrate the soil properly. To rotate the Point, remove the Roll Pin, remove the Point, turn and replace it insuring the Instep is secured into place. Then replace the Roll Pin.

There are two replaceable Points available. The ductile cast alloy Point (P/N 681-002) is recommended for low abrasion soils containing rocks and stones. The Chromium Carbide Alloy Point (P/N 681-002HF) is much harder and more brittle, and is recommended for high abrasion soils and will provide much longer wear.

⚠ Do not hit the chromium carbide points with a hammer or breakage may occur.

The Shatter Plate is hinged on the rear of the Paratill leg and held onto the Leg by two tabs. When removing an old Shatter Plate, the two tabs (top and bottom) must be bent to allow the old Shatter Plate to be removed. Likewise, when the new one is installed, the tabs must be bent to secure it to the Leg. The Shatter Plate may be used on the right or left Leg by locating the hexagon wedge, which is bolted to the rear side of the Plate, in the appropriate threaded hole.

The Shatter plate position is adjustable to increase the soil loosening effect. When the Paratill is operated in heavy soils or highly compacted soils, the Shatter plate angle should be increased by adjusting the position of the hexagon wedge behind the Shatter Plate. A greater Shatter Plate angle will result in an increased wear rate on the Shatter Plate.

Disc Coulters:

Heavy duty spring loaded swivel coulters are for use when operating in heavy residue conditions or when surface vegetation is present. Do not operate the disc coulters too deep. Only the rippled part of the coulters need be in the ground.

Operating depth is adjusted by placement of the top portion of the coulters shank in the clamp body.

The disc coulters blade should be replaced when the ripples are worn off.

1. Grease pivot point on the hinge every week of operation or more often under extreme conditions. Grease fittings are located in the front and the rear of the hinge casting.
2. Repack wheel bearings at least once every operating season or more often under extreme conditions. Inspect internal parts and replace worn parts if needed.
3. Inspect bolts on the clamp body periodically and tighten if necessary. Use bolts of the proper size and grade if replacement is necessary. Keep set screws tight to keep coulters at proper operating depth. Always check bolts and set screws after 30 minutes of operation when any adjustments are made.

⚠ Coulters Blades are sharp and capable of causing severe cuts.

Picture 3

Gauge Wheels:

Working depth of the PARATILL is partially controlled by raising or lowering the wheels by adjustment of the screw jack. Do not operate the gauge wheels in previously loosened soil as recompaction will occur.

Picture 4

The wheel can be placed in many different positions along the tool bar.

For total loosening, gauge wheels can be placed at virtually any position for desired results. In a zone loosening configuration it is usually best to place the wheel in the center of a furrow for stability. **Note:** Side to side travel of disc coulters must be taken into consideration for placement of gauge wheels. Allow ample spacing so that the coulters disc blade will not cut the tire.

The tractors three-point hitch should always be set to carry part of the PARATILL load:

- A. To effect weight transfer to the tractor and increase traction.
 - B. To prevent overload and possible damage to the gauge wheels.
1. Repack wheel bearings at least once every operating season or more often under extreme conditions. Inspect internal parts and replace worn parts if needed.
 2. **Inflate and keep tire pressure at 70 psi.**
 3. Keep jam nut tight when screw jack is at proper adjustment.
 4. Check bolts on the mount assembly and screw jack lug periodically and tighten if necessary. Use bolts of the proper size and grade if replacement is necessary. Always check bolts after 30 minutes of operation when adjustments have been made.

Leg: Shear Bolt

1. Each of the legs is protected by a shear bolt in the front hole attaching the leg to the clamp. The shear bolt is designed to break at a pre-set level that will prevent damage to other PARATILL components.

Use of a higher grade bolt without the special machined cuts could result in breakage or failure of machine components and will void the warranty. When replacing a shear bolt,

carefully line up the holes before inserting the replacement bolt. (P/N 610-1822Z).

2. A Grade 5 bolt (P/N 602-1822Z) is placed in the rear of the clamp

to provide a pivot in the event of shear bolt breakage. Do not place a shear bolt in the rear of the clamp.

3. The clamp is designed to allow the leg to be set in three different positions from front to back. If coulters are used on the front bar, the middle or back positions should be used.

4. U-Bolts that attach the clamp to the tool bar should be kept tight, particularly after adjustments have been made. When making adjustments, U-Bolts may be loosened but not removed to allow the clamp and leg to slide along the tool bar.

Leg Wear Parts

Each leg is protected by six high quality, replaceable wear parts: 5. Point, 6. Instep, 7. Lower Shin, 8. Upper Shin, 9. Shatter Plate, and 10. Landside.

Picture 2

Insure all leg wearing parts are changed before damage occurs to the Leg (or Foot).

Each part should be replaced as it becomes worn. Failure to replace worn parts could result in permanent Leg damage. See Parts Diagram on Page 14.

There are two Wear Shins per Leg; The right-hand Shins are different from the left-hand Shins. The Lower Shins are shorter than the Upper ones, and they usually require replacement more often due to their location in a greater wear area than the upper ones.

The Landside (P/N 681-006) is made of a hardened alloy material and is designed to support the rear of the point.

The Wear Point is reversible and self-sharpening and should be rotated or turned over before the Point has become pointed on the end or worn excessively. Another indication that the Points need to be turned or replaced is when the Paratill unit fails to penetrate the soil properly. To rotate the Point, remove the Roll Pin, remove the Point, turn and replace it insuring the Instep is secured into place. Then replace the Roll Pin.

There are two replaceable Points available. The ductile cast alloy Point (P/N 681-002) is recommended for low abrasion soils containing rocks and stones. The Chromium Carbide Alloy Point (P/N 681-002HF) is much harder and more brittle, and is recommended for high abrasion soils and will provide much longer wear.

⚠ Do not hit the chromium carbide points with a hammer or breakage may occur.

The Shatter Plate is hinged on the rear of the Paratill leg and held onto the Leg by two tabs. When removing an old Shatter Plate, the two tabs (top and bottom) must be bent to allow the old Shatter Plate to be removed. Likewise, when the new one is installed, the tabs must be bent to secure it to the Leg. The Shatter Plate may be used on the right or left Leg by locating the hexagon wedge, which is bolted to the rear side of the Plate, in the appropriate threaded hole.

The Shatter plate position is adjustable to increase the soil loosening effect. When the Paratill is operated in heavy soils or highly compacted soils, the Shatter plate angle should be increased by adjusting the position of the hexagon wedge behind the Shatter Plate. A greater Shatter Plate angle will result in an increased wear rate on the Shatter Plate.

Attaching Tractor to PARATILL

Choosing the proper tractor:

1. It is extremely important to utilize a tractor with sufficient horsepower and traction. Soil conditions will effect horsepower requirements, but allow 30-40 hp. per leg, i.e., 4 legs requires a 120 - 160 hp. tractor.
2. The PARATILL is equipped with high clearance trash legs. The three-point linkage of the tractor must allow 36 inches between the ground and the lower hitch points in the "fully raised" position to provide adequate transport clearance.
3. Insure that both the right and left lift arms are identical in length, and the tool bar is level (right to left). They must be equal to achieve uniform operating depth and transport clearance.
4. The three-point lift linkage should be locked into the fixed position, not the float position.
5. Sway blocks or stabilizing chains should be adjusted to minimize lateral movement.
6. Insure tractor has sufficient front end weight to permit constant positive steering at all times.
7. Traction and horsepower are the two most limiting factors effecting Paratill tractor operation.

CAUTION

NEVER STAND BETWEEN TRACTOR AND PARATILL WITH THE TRACTOR ENGINE RUNNING.

A. Tractors Equipped With Quick Hitches:

1. Attach quick hitch to the PARATILL and make sure lower pin locks are secured.
2. Raise the parking stand into the clamp body or remove to allow the PARATILL into a working position.
3. When disconnecting the PARATILL adjust stands to leave the Tool Bar tilted slightly forward. This will permit easier disconnecting and reattaching.

 **WARNING: Never Work under the PARATILL When it is in the raised position. Always lower the unit to the ground before making any adjustments.**

Tractors Without Quick Hitch:

1. Attach lower lift arms of the tractor to the PARATILL utilizing appropriate pins. Standard equipment for all units is a Category III wide hitch with 1-7/16" Lower and 1-1/4" Upper Pin diameters.
2. Attach top link after connecting lower lift arms. Raise parking stands into clamps or remove. When disconnecting, place stand to leave the PARATILL in a stable position.

CAUTION

DO NOT MOVE TRACTOR WITHOUT MAKING SURE TOP HITCH IS CONNECTED TO TRACTOR.

Field Use and Adjustments

NEVER ALLOW ANYONE TO RIDE ON THIS EQUIPMENT DURING OPERATION

1. Maximum operating speed 4 - 6 mph. If obstructions are present, lower operating speed to a safe level. This will help minimize damage.
2. Working depth of 14"-16". Check the working depth by the position of the soil surface on the back of the leg. The top bolt attaching the upper shin represents approximately a 16" working depth; the next lower bolt approximately 14". Therefore, while the unit is operating, the soil flow should be between these two bolts. Adjust the depth by raising or lowering the depth control wheels.
3. **The frame must be horizontal (level) front to back when in use.** Adjust by lengthening or shortening the tractor's top link.
4. Check and adjust if necessary the coulter position in relation to the leg coulter working depth. The coulter should run directly in front of the leg with the coulter cutting a track directly in front of the sharpened edge of the upper shin.
5. Raise the shatter plate position if additional loosening is required.
6. Never reverse the tractor when the PARATILL is in the ground. Loss of the shatter plates will result.
7. Do not raise the PARATILL out of the ground unless the tractor is moving forward.
8. Do not make sharp turns when the PARATILL is in the ground.

BIGHAM BROTHERS, INC.

SYMPTOM	CAUSE	SOLUTION
Cloddy	Shatter plate too high	Lower shatter plate
	Operating too shallow	Raise gauge wheels
	Wire or foreign object on leg or foot	Lower hydraulic lever setting Remove wire or object
	Soils too dry	Wait for moisture
Shearing bolts	Too much load, Rocks	Reduce operating depth
Trash dragging on leg	Coulter not aligned	Check coulter alignment on front bar
	Coulter not low enough	Lower coulter shank in clamp body
	Soil too wet causing hairpinning of residue	Let soil dry
Tractor tire slippage	Tractor too small	Lengthen third link
	Third link too short	Add weight; lock axles (if tractor is equipped)
	Insufficient traction	Adjust tractor's draft control
	Soil too wet	Let Soil Dry
Tractor will not pull PARATILL	Insufficient horsepower Insufficient traction	Larger, heavier tractor Set Paratill to operate at shallower depth Remove two (2) legs
Beds or rows relocated	Uplifting and movement of soil	Relocate leg closer or further from desired row or ridge
Losing shatter plates	Backing with unit in the ground	Raise unit before backing
Wear on leg	Wear surfaces worn	Replace wear surfaces
Loss of instep	Excess point wear Improper mounting	Replace point Insure position locked by point
Not going into ground	Points dull Unit not level	Replace points Level Unit
"Mole hole" where point operates	Soil too wet	Allow ground to dry
Unit does not pull straight	Points are not uniform	Replace points
Uneven surface	Incorrect leg position Shatter plate too high Operating too shallow	Reposition leg Adjust hexagon wedge Lower operating depth

Paratill General Set-Up Notes (Zone Loosening)

Leg Mounting

Coulter Adjustment

A. Initial height setting

11"

B. Clamp on front of tool bar.

C. Round portion of coulter shank to the rear.

A. Clamp angles on rear two bars.

B. Leg mounted in center holes. Shear bolt in front hole.

Rear Buster Adjustment

A. Initial Height Setting

B. Clamp on rear of tool bar.

C. Front of trip slot against top bolt.

D. Buster Block with ridges up, seated on foot piece

E. Carriage bolt pushed up in lower slot of foot piece.

F. Set buster to run as flat as possible.

Hitch Mounting

A. Top link on center of top head bar (decal up)

B. Bolts through bottom pull point. Nuts on top.

C. Seat Click and roll pin in chain link pocket.

D. Lower pull point placement

Top Hitch View

Gauge Wheel Adjustment

A. Mount on middle bar with wheel forward.

B. Initial height setting

C. Tighten jam nut

D. Maintain tire pressure at 70 PSI.

Figure 8: General Set-Up Notes

BIGHAM BROTHERS, INC.

Mechanical Trip Leg Assembly: Operation and Maintenance Instructions.

Each Leg is protected by a mechanical trip mechanism which will trip under extreme point pressure or collision with an obstruction. The leg will trip and pivot up and to the rear. To reset the leg into the operating position, simply raise the Paratill out of the ground. The Leg should automatically lower and reset for operation. Lower the unit into the operating position and continue.

**NEVER WALK CLOSELY
BEHIND A LEG**

**Equipped With a Mechanical
Trip Bracket. The Leg may
spontaneously trip and rotate
to the rear causing serious injury.**

Adjusting the Mechanical Trip Bracket:

Each Trip Bracket is equipped with shims placed under a retaining bolt located under the toggle trip lower tab.

Picture 5: Retaining bolt for shims under toggle.

The trip force for each leg can be adjusted higher by removing one or two shims. Each shim removed will increase the force to trip the Leg by about 400 pounds. Removal of shims will place leg and trip mechanism under greater stress.

Always block the leg securely to make adjustments to the trip mechanism.

WARNING!

**Finger and hand may be
pinched severely if Leg is
allowed to fall to the reset
position while changing shims.
Block the leg securely before
changing shims. Failure to do
so could result in serious injury.**

Trip Check Measuring Tool:

Each Mechanical Trip Paratill is shipped with a measuring tool to check linkage after shims have been added or removed.

Measure each Leg Bracket after adding or removing shims. Failure to do so could result in damage to Legs or trip mechanism.

Note: Be sure to tighten shim fastening bolt before returning leg to operating (down) position.

Measuring Procedure:

1. Rotate the top spring fastening bracket to the front part of the trip bracket. Removal of lower nut from eye bolt may be necessary.
2. Seat the measuring tool down to the top bolt in the groove closest to the toggle retaining spring. (Picture 6)

Picture 6: Seat measuring tool on top pivot bolt.

3. Seat the lower part of the measuring tool on the lower linkage pin (**not on the snap ring**). (Picture 7)

Picture 7: Seat lower portion of measuring tool on lower pin.

4. Measure the distance between the lower edge of the measuring tool and the upper edge of the pin. (Picture 8)

Picture 8: Measure distance between measuring tool and pin.

The following specifications must be maintained after changing shims.

Measure the distance between the bottom of the measuring tool and the top of the pin.

Maximum distance: 3/8"

Minimum distance: 1/8"

Exceeding maximum distance could result in failure and damage to Leg and Trip Mechanism.

Failure to maintain minimum distance will result in frequent trip of the leg.

GRADE 5
3 Lines on Bolt Head

RECOMMENDED ASSEMBLY TORQUES FOR HEXAGON HEAD CAP SCREWS

Based on dry assembly. Variables such as lubrication, plating etc. may reduce the values listed below as much as 20%, and must be taken into consideration.

	Bright Cap Screws 1018 Grade 2			Heat Treated 1038 Hexagon Head Cap Screws, SAE Grade 5			
Cap Screw Diam.	Yield Strength PSI Min.	Recommended Torque (Ft. Lbs.)		Yield Strength PSI Min.	Tensile Strength PSI Min.	Recommended Torque (Ft. Lbs.)	
		UNC	UNF			UNC	UNF
1/4"	58,000	6	7	90,000	120,000	11	13
5/16"	58,000	13	14	90,000	120,000	21	23
3/8"	58,000	23	26	90,000	120,000	38	40
7/16"	58,000	37	41	90,000	120,000	55	60
1/2"	58,000	57	64	90,000	120,000	85	95
5/8"	55,000	111	128	90,000	120,000	175	210
3/4"	55,000	200	223	90,000	120,000	300	330
7/8"	55,000	315	340	81,000	115,000	450	490
1"	50,000	400	460	81,000	115,000	680	715
1-1/8"	50,000	570	635	77,000	105,000	885	990

General Formula for calculating Torque is as follows:

Torque in Inch Lbs. = .2 x Nominal Diameter of Screw x Load in Lbs., where Load = 80% of Yield Strength, expressed in Lbs., not pounds per square inch.

The tension induced in a cap screw may be checked by measuring overall length before torquing and then under torque load. The screw stretches .001" per inch of screw length for each 30,000# P.S.I. induced tension. Applies only to loads below the yield point.
